

Waterproof Foam Dressing

Fenestrated Tracheostomy, with Adhesive Border

ProCure Waterproof Foam Dressing with Adhesive Border is a moderately absorbent, waterproof sterile foam dressing. It is structured to retain moderate exudate, while maintaining a moist wound environment.

The dressing has a waterproof adhesive backing and a sterile foam cushioning that easily adheres to the skin and seals the wound bed, protecting against bacterial contamination. The waterproof outer layer of the dressing prevents water or other liquids from penetrating the wound site, making it ideal for use in wet environments or for patients who may need to shower or bathe while wearing the dressing. The adhesive border provides a secure and comfortable fit, helping to keep the dressing in place and preventing it from slipping or rolling.

Our Waterproof Bordered Foam Wound Dressing with Adhesive Border is available in a round, fenestrated version with a radial slit and starburst opening for convenient application to tube sites.

ENHANCED PATIENT COMFORT

Multi-layered composite dressings are designed to be medium absorbent, while still being gentle to the skin, minimizing pain during dressing changes.

Not made with
natural rubber latex.

Features & Benefits:

- Bacterial and fluid barrier
- Flexible and conformable with radial slit and starburst opening
- Ideal for tracheostomy or stoma care
- Non-adhesive for easy application and removal
- Helps maintain a moist environment
